Team: Sérgio Gasalho (84760), Mariana Pinto (84792), Ariana Gonçalves (89194),
Sofia Vaz (92960), Eduardo Cruz (93088) - GROUP 6

PEI 20/21: Prof. José Rafael, Prof. Osvaldo Pacheco, Prof. José Vieira, Prof. Cláudio Teixeira

Mentors: Prof. João Paulo Barraca, Prof. Cláudio Teixeira

Context

HOW THINGS ARE CURRENTLY DONE

The gaps that made it possible for our solution to come about.

Outdated model

Manual
advertisement
through email, social
media and flyers
around the University
campus

Lack of information

Event goers that aren't
knowledgeable with
the way the campus is
organized get lost
when trying to go to
events

Lack of a centralized system

Currently there's no
system working as an
event repository, nor
is there an automated
way to book rooms.

PRODUCT

What is Eventos.UA?

Online platform

Accessible platform to gather all the event's information

Organize events

Create, manage and attend events with one app

Resources

Django, PostgreSQL, Docker and additional API's

Product

First stage

How it was when the project first started

Documentation

Barely there and often
contradictory

Features

Some were done, but
the project was not
ready to be released

Broken environment

Docker files weren't
well configured,
missing
requirements,...

Current stage

Where development currently is

Events

The user can freely
create events

Mobile app

The mobile app
completed, and truly
enhances the webapp

Look and feel

Web app has the same
look and feel as other
University websites

Requirements and where they are right now

Where we look back at what we talked about all throughout the semester and see what was done

Room API

The API was delivered, incomplete, close to the deadline, so it was impossible to fully integrate it

Payment API

Fully integrated, but probably won't be a part of the release

Access anywhere

Possible thanks to the mobile app

An aerial photograph of a large outdoor event, likely a graduation ceremony, held in a modern university courtyard. The courtyard is paved and features several large, mature trees and a central circular area with a geometric design. A large crowd of people, many wearing white caps and gowns, is seated in rows of white plastic chairs. In the background, there are several multi-story brick and concrete buildings. A stage area is visible on the right side of the courtyard, with a few people standing on it. The overall atmosphere is formal and organized.

Future

Where the product will go next

Things that could've been, but weren't

Room API

Once the API is fully functional it should also be fully integrated with the app

Bug hunting

The applications were thoroughly tested, but more tests never hurt

New client

Sadly, not all of the second client's requirements are as well fleshed out as they could be

Will that happen though?

The nearer future of the product and the team

Testing with the administration

Soon there will be a demo with the dean, and maybe even the rector

Team wide introspection

The team will ask itself what it did right, what it did wrong, and where each one can grow

Celebration

Whether or not the university continues with the product we created, we are proud of our work and we poured our hearts and souls into it

And now, for the final time,

Thank you

"An informed campus is an active campus"
